

FSDM311A

Green Mode Fairchild Power Switch (FPS™)

Features

- Internal Avalanche-Rugged SenseFET
- Precision Fixed Operating Frequency: 67KHz
- Consumes Under 0.2W at 265V_{AC} & No Load with Advanced Burst-Mode Operation
- Internal Start-up Circuit
- Pulse-by-Pulse Current Limiting
- Over-Voltage Protection (OVP)
- Overload Protection (OLP)
- Internal Thermal Shutdown Function (TSD)
- Auto-Restart Mode
- Under-Voltage Lockout (UVLO) with Hysteresis
- Built-in Soft-Start
- Secondary-Side Regulation

Applications

- Charger & Adapter for Mobile Phone, PDA, & MP3
- Auxiliary Power for White Goods, PC, C-TV, & Monitors

Description

The FSDM311A consists of an integrated Pulse Width Modulator (PWM) and SenseFET, and is specifically designed for high-performance, off-line, Switch-Mode Power Supplies (SMPS) with minimal external components. This device is an integrated high-voltage power switching regulator that combines a VDMOS SenseFET with a voltage-mode PWM control block. The integrated PWM controller features include a fixed oscillator, Under-Voltage Lockout (UVLO) protection, Leading-Edge Blanking (LEB), an optimized gate turn-on/turn-off driver, Thermal Shutdown (TSD) protection, and temperature-compensated precision-current sources for loop compensation and fault protection circuitry. When compared to a discrete MOSFET and controller or RCC switching converter solution, the FSDM311A device reduces total component count and design size and weight, while increasing efficiency, productivity, and system reliability. This device provides a basic platform that is well suited for the design of cost-effective flyback converters.

Ordering Information

Product Number	Package	Marking Code	BV _{DSS}	f _{osc}	R _{DS(ON)}
FSDM311A	8DIP	DM311A	650V	67KHz	14Ω

All packages are lead free per JEDEC: J-STD-020B standard.

FPS™ is a trademark of Fairchild Semiconductor Corporation.

Typical Application & Output Power Table

Figure 1. Typical Flyback Application

Product	Open Frame ⁽¹⁾	
	230V _{AC} ±15% ⁽²⁾	85~265V _{AC}
FSDM311A	13W	8W

Notes:

1. Maximum practical continuous power in an open-frame design with sufficient drain pattern as a heat sink, at 50°C ambient.
2. 230V_{AC} or 100/115V_{AC} with doubler.

Internal Block Diagram

Figure 2. Functional Block Diagram

Pin Configuration

Figure 3. 8-Lead DIP Pin Assignments (Top View)

Pin Definitions

Pin #	Name	Description
1	GND	Ground. SenseFET source terminal on primary side and internal control ground.
2	Vcc	Positive supply voltage input. Although connected to an auxiliary transformer winding, current is supplied from pin 5 (Vstr) via an internal switch during start-up (see the <i>Internal Block Diagram in Figure 2</i>). It is not until V _{CC} reaches the UVLO upper threshold (9V) that the internal start-up switch opens and device power is supplied via the auxiliary transformer winding.
3	Vfb	Feedback. Inverting input to the PWM comparator with its normal input level lies between 0.5V and 2.5V. It has a 0.4mA current source connected internally, while a capacitor and opto-coupler are typically connected externally. A feedback voltage of 4.5V triggers overload protection (OLP). There is a time delay while charging external capacitor C _{FB} from 3V to 4.5V using an internal 5μA current source. This time delay prevents false triggering under transient conditions, but allows the protection mechanism to operate under true overload conditions.
4	NC	No Connection.
5	Vstr	Start-up. This pin connects directly to the rectified AC line voltage source. At start-up, the internal switch supplies internal bias and charges an external storage capacitor placed between the Vcc pin and ground. Once the V _{CC} reaches 9V, the internal switch stops charging the capacitor.
6,7,8	Drain	SenseFET Drain. The drain pins are designed to connect directly to the primary lead of the transformer and are capable of switching a maximum of 650V. Minimize the length of the trace connecting these pins to the transformer to decrease leakage inductance.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only. $T_A=25^{\circ}\text{C}$, unless otherwise specified.

Symbol	Parameter	Value	Unit
V_{DRAIN}	Drain Pin Voltage	650	V
V_{STR}	Vstr Pin Voltage	650	V
V_{DG}	Drain-Gate Voltage	650	V
V_{GS}	Gate-Source Voltage	± 20	V
I_{DM}	Drain Current Pulsed ⁽³⁾	1.5	A
I_{D}	Continuous Drain Current ($T_C=25^{\circ}\text{C}$)	0.5	A
I_{D}	Continuous Drain Current ($T_C=100^{\circ}\text{C}$)	0.32	A
E_{AS}	Single Pulsed Avalanche Energy ⁽⁴⁾	10	mJ
V_{CC}	Supply Voltage	20	V
V_{FB}	Feedback Voltage Range	-0.3 to V_{STOP}	V
P_{D}	Total Power Dissipation	1.40	W
T_{J}	Operating Junction Temperature	Internally limited	$^{\circ}\text{C}$
T_{A}	Operating Ambient Temperature	-25 to +85	$^{\circ}\text{C}$
T_{STG}	Storage Temperature	-55 to +150	$^{\circ}\text{C}$

Notes:

- Repetitive rating: Pulse width is limited by maximum junction temperature.
- $L = 24\text{mH}$, starting $T_{\text{J}} = 25^{\circ}\text{C}$

Thermal Impedance

$T_A=25^{\circ}\text{C}$, unless otherwise specified.

Symbol	Parameter	Value	Unit
8DIP			
θ_{JA}	Junction-to-Ambient Thermal Impedance ⁽⁵⁾	88.84	$^{\circ}\text{C/W}$
θ_{JC}	Junction-to-Case Thermal Impedance ⁽⁶⁾	13.94	$^{\circ}\text{C/W}$

Notes:

- Free standing with no heatsink; without copper clad. (Measurement Condition – just before junction temperature T_{J} enters into OTP).
- Measured on the DRAIN pin close to plastic interface.
- All items are tested with the standards JESD 51-2 and 51-10 (DIP).

Functional Description

1. Start-up: At start-up, the internal high-voltage current source supplies the internal bias and charges the external V_{CC} capacitor, as shown in Figure 15. When V_{CC} reaches 9V, the device starts switching and the internal high-voltage current source stops charging the capacitor. The device is in normal operation provided V_{CC} does not drop below 7V. After start-up, the bias is supplied from the auxiliary transformer winding.

Figure 15. Internal Start-up Circuit

Calculating the V_{CC} capacitor is an important step in design with the FSDM311A. At initial start-up, the maximum value of start operating current I_{START} is about 100 μ A, which supplies current to UVLO and V_{REF} blocks. The charging current I_{VCC} of the V_{CC} capacitor is equal to $I_{STR} - 100\mu A$. After V_{CC} reaches the UVLO start voltage, only the bias winding supplies V_{CC} current to the device. When the bias winding voltage is not sufficient, the V_{CC} level decreases to the UVLO stop voltage and the internal current source is activated again to charge the V_{CC} capacitor. To prevent this V_{CC} fluctuation (charging/discharging), the V_{CC} capacitor should be chosen for a value between 10 μ F and 47 μ F.

Figure 16. Charging V_{CC} Capacitor through V_{STR}

2. Feedback Control: The FSDM311A is the voltage-mode controlled device, as shown in Figure 17. Usually, an opto-coupler and shunt regulator, such as KA431, are used to implement the feedback network. The feedback voltage is compared with an internally generated sawtooth waveform that directly controls the duty cycle. When the shunt regulator reference pin voltage exceeds the internal reference voltage of 2.5V, the opto-coupler LED current increases, the feedback voltage V_{FB} is pulled down, and it reduces the duty cycle. This happens when the input voltage increases or the output load decreases.

Figure 17. PWM and Feedback Circuit

3. Leading-Edge Blanking (LEB): At the instant the internal SenseFET is turned on, the primary-side capacitance and secondary-side rectifier diode reverse recovery typically cause a high-current spike through the SenseFET. Excessive voltage across the R_{SENSE} resistor leads to incorrect pulse-by-pulse current limit protection. To avoid this, a leading-edge blanking (LEB) circuit disables pulse-by-pulse current limit protection block for a fixed time (t_{LEB}) after the SenseFET turns on.

4. Protection Circuit: The FSDM311A has several protective functions, such as overload protection (OLP), over-voltage protection (OVP), under-voltage lockout (UVLO), and thermal shutdown (TSD). Because these protection circuits are fully integrated in the IC without external components, the reliability is improved without increasing costs. Once a fault condition occurs, switching is terminated and the SenseFET remains off, which causes V_{CC} to fall. When V_{CC} reaches the UVLO stop voltage, V_{STOP} (7V), the protection is reset and the internal high-voltage current source charges the V_{CC} capacitor via the V_{STR} pin. When V_{CC} reaches the UVLO start voltage, V_{START} (9V), the device resumes normal operation. In this manner, the auto-restart can alternately enable and disable the switching of the power SenseFET until the fault condition is eliminated.

Figure 18. Protection Block

4.1 Overload Protection (OLP): Overload is defined as the load current exceeding a pre-set level due to an unexpected event. In this situation, the protection circuit should be activated to protect the SMPS. However, even when the SMPS is operating normally, the overload protection (OLP) circuit can be activated during the load transition. To avoid this undesired operation, the OLP circuit is designed to be activated after a specified time to determine whether it is a transient situation or an overload situation. If the output consumes more than the maximum power determined by I_{LIM} , the output voltage (V_O) decreases below its rating voltage. This reduces the current through the opto-coupler LED, which also reduces the opto-coupler transistor current, thus increasing the feedback voltage (V_{FB}). If V_{FB} exceeds 3V, the feedback input diode is blocked and the $5\mu A$ current source (I_{DELAY}) starts to charge C_{FB} slowly up to V_{CC} . In this condition, V_{FB} increases until it reaches 4.5V, when the switching operation is terminated, as shown in Figure 19. The shutdown delay time is the time required to charge C_{FB} from 3V to 4.5V with $5\mu A$ current source.

Figure 19. Overload Protection (OLP)

4.2 Thermal Shutdown (TSD): The SenseFET and the control IC are integrated, making it easier for the control IC to detect the temperature of the SenseFET. When the temperature exceeds approximately 145°C, thermal shutdown is activated.

5. Soft-Start: The FPS has an internal soft-start circuit that slowly increases the feedback voltage with the SenseFET current right after it starts up. The typical soft-start time is 15ms, as shown in Figure 20, where progressive increment of the SenseFET current is allowed during the start-up phase. The soft-start circuit progressively increases current limits to establish proper working conditions for transformers, inductors, capacitors, and switching devices. It also helps to prevent transformer saturation and reduces the stress on the secondary diode.

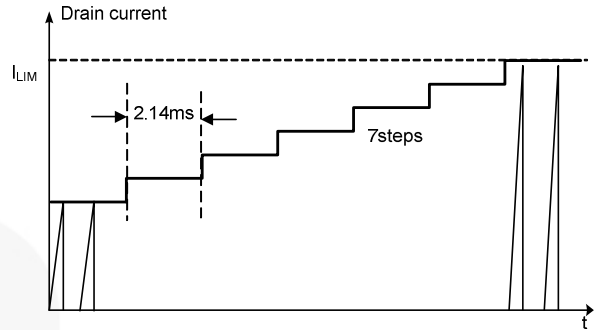

Figure 20. Internal Soft-Start

6. Burst Operation: To minimize the power dissipation in standby mode, the FSDM311A enters burst mode operation. As the load decreases, the feedback voltage decreases. The device automatically enters burst mode when the feedback voltage drops below V_{BURL} (0.55V). At this point, switching stops and the output voltages start to drop. This causes the feedback voltage to rise. Once it passes V_{BURH} (0.70V), switching starts again. The feedback voltage falls and the process repeats. Burst mode operation alternately enables and disables switching of the power MOSFET to reduce the switching loss in standby mode.

Figure 21. Burst Operation Block

Figure 22. Burst Operation Function

Application Information

Methods of Reducing Audible Noise

Switching-mode power converters have electronic and magnetic components that generate audible noise when the operating frequency is in the range of 20~20,000Hz. Even though they operate above 20kHz, they can make noise, depending on the load condition. Designers can employ several methods to reduce noise.

Glue or Varnish

The most common method involves using glue or varnish to tighten magnetic components. The motion of core, bobbin, and coil; and the chattering or magnetostriction of core, can cause the transformer to produce audible noise. The use of rigid glue and varnish helps reduce transformer noise, but can crack the core. This is because sudden changes in the ambient temperature cause the core and the glue to expand or shrink at a different rate.

Ceramic Capacitor

Using a film capacitor instead of a ceramic capacitor as a snubber capacitor is another noise-reduction solution. Some dielectric materials show a piezoelectric effect, depending on the electric field intensity. A snubber capacitor becomes one of the most significant sources of audible noise. It is possible to use a Zener clamp circuit instead of an RCD snubber for higher efficiency as well as lower audible noise.

Adjusting Sound Frequency

Moving the fundamental frequency out of the 2~4kHz range another method of reducing perceptible noise. Generally, humans are more sensitive to noise in the range of 2~4kHz. When the fundamental frequency of noise is located in this range, it is perceived as louder, although the noise intensity level is identical (refer to Figure 23, Equal Loudness Curves).

If burst-mode operation is suspected to be a source of noise, this method may be helpful. If the frequency of burst-mode operation lies between 2~4 kHz, adjusting the feedback loop can shift the frequency. To reduce the burst operation frequency, increase a feedback gain capacitor (C_F), opto-coupler supply resistor (R_D), and feedback capacitor (C_B); and decrease a feedback gain resistor (R_F), as shown in Figure 24.

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. TO OBTAIN THE LATEST, MOST UP-TO-DATE DATASHEET AND PRODUCT INFORMATION, VISIT OUR WEBSITE AT [HTTP://WWW.FAIRCHILDSEMI.COM](http://www.fairchildsemi.com). FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

AUTHORIZED USE

Unless otherwise specified in this data sheet, this product is a standard commercial product and is not intended for use in applications that require extraordinary levels of quality and reliability. This product may not be used in the following applications, unless specifically approved in writing by a Fairchild officer: (1) automotive or other transportation, (2) military/aerospace, (3) any safety critical application – including life critical medical equipment – where the failure of the Fairchild product reasonably would be expected to result in personal injury, death or property damage. Customer's use of this product is subject to agreement of this Authorized Use policy. In the event of an unauthorized use of Fairchild's product, Fairchild accepts no liability in the event of product failure. In other respects, this product shall be subject to Fairchild's Worldwide Terms and Conditions of Sale, unless a separate agreement has been signed by both Parties.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Terms of Use

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
